Description

In a hand guiding application, the robot allows a limited amount of its motion control to be released, allowing the operator to manually move the robot to various positions. This application has been primarily used to teach programs, especially when new parts are added frequently. It may be done with traditional and collaborative robots, with some difference in safety requirements.

Information can be found in the Industrial Robots and Robot Systems – Safety Requirements standard, ANSI RIA R15.06-2012, which is harmonized with ISO 10218-1:2011 and ISO 10218-2:2011.

Detailed collaborative safety requirements will be available in the ISO/TS 15066 Technical Specification, which is expected to be available in late 2015 or early 2016.

Definitions

Collaborative Workspace
It is the space within the operating space where the robot system and a human can perform tasks concurrently.

End-Effector
This is a device attached to the end of the robot’s/collaborative robot’s arm (mechanical interface). It allows a task to be done.

This may also be referred to as end-of-arm tools.

Safety-Rated Monitored Stop
The robot/collaborative robot stops before the operator enters the collaborative workspace.

With a traditional robot this may be achieved with a safety-rated control system that complies with the requirements in ANSI/RIA 15.06-2012.

With a collaborative robot this may be achieved through inherently-safe design.

Safety-Rated Space Limiting
A limit is placed on the robot’s range of motion by a software- or firmware-based system having a sufficient safety-rated performance.
Guidelines for all Systems

These guidelines are applicable for traditional and collaborative robot systems. Detailed information can be found in the ISO/TS 15066 technical specification.

• The operator is responsible for the robot’s motion during the hand-guiding process. This includes being aware of surrounding equipment and prevent being crushed between the robot and auxiliary equipment, walls, columns, barriers, etc.
• If the operator’s safety is dependent on limiting the robot’s range of motion, the application can use the robot’s safety-rated soft axis and space limiting functions or other external safety-rated system.
• The robot system must utilize safety-rated reduced speed control and the safety-rated monitored speed controls, as specified in ANSI/RIA R15.06.
• The motion direction must be intuitive to the operator. For example, if an operator is using a joystick type device and presses left, the robot should move in the left direction.
• Transition to and from a hand guiding application should
  a. be a deliberative and controlled behavior
  b. not lead to unexpected motions or behaviors
  c. not create additional hazards
• The robot is not allowed to be moving when the operator enters the collaborative workspace.
• The collaborative workspace is defined as any area where the robot can move. In many cases this will be the same as the robot’s defined workspace (including the end-effector and part).
• If an operator enters the collaborative workspace while the robot is moving, the robot shall generate a protective stop. The operator must reset the system before the hand guiding can be started.
• The operator must activate the force guiding feature before the robot can enter hand guiding mode.
• The robot shall not resume normal operation until the operator(s) has left the safeguarded space. Additional means requiring operator verification, such as the operator pressing a restart button, may be used.
• If operator safety is dependent on the movement or location of the robot, the robot shall have a way to knowing its position.

Note: Each application is unique and may include topics not listed.
Omron Corporation
80 years experience in sensing and control
- Over 37,500 employees worldwide
- Support in every European country
- Over 1,500 employees in 22 countries in EMEA
- 800 specialized field engineers
- 6% of turnover invested in R&D
- More than 200,000 products
- 12,500+ issued and pending patents

Omron Industrial Automation
Headquartered in Kyoto, Japan, Omron Corporation is a global leader in the field of automation. Established in 1933. Omron has more than 37,500 employees in over 200 locations worldwide working to provide products and services to customers in a variety of fields including industrial automation, electronic components industries, and healthcare. The company is divided into five regions and head offices are in Japan (Kyoto), Asia Pacific (Singapore), China (Hong Kong), Europe (Amsterdam) and US (Chicago). The European organisation has its own development and manufacturing facilities, and provides local customer support in all European countries. For more information, visit Omron's Website at www.industrial.omron.eu
